

ABSTRACT OF THE DISCLOSURE

There is provided a liquid crystal panel in which the brightness of an image is high, and deterioration in display quality due to defects such as uneven display or uneven brightness is suppressed. The liquid crystal panel includes a pixel portion including a plurality of thin film transistors and pixel electrodes formed on a first substrate, a second substrate, a liquid crystal and gap holding members provided between the first substrate and the second substrate, and a microlens array including a plurality of microlenses and provided on a surface of the second substrate, the surface being opposite to the first substrate.
